Yesterday I was just trying to download the Borderlands 2 DLC to see if I could play it on my Vita that has Borderlands 1 and 2 on it. While playing the update manager, I noticed that it had found new updates for Borderlands 2. I checked out the "Headhunter" DLC and I saw that it was coming out on April 22, 2014. I was pretty excited, so I told my girlfriend and my friend to come over because they could all play it together. My girlfriend bought the game for me, and then my friend bought one for herself. We downloaded the game on the PS3 and PS4, and then we loaded Borderlands 2 on the Vita. All the DLC was downloaded and I opened the game up. Then it asked me to connect to the PSN Store. I did, but the store wouldn't open. I went back to the Vita, clicked the console button, went to connect, then turned it off. I turned it on, tried again, and it wouldn't work. Then, I turned it off again. I turned it on again and it said that I was missing a digital code. I put in the code from the game, and it said that the code was invalid. I went to the store, tried again, and it worked. I tried the rest of the games and it worked. When it was finished installing, it said that it was now connected to the PSN Store. It went to the Borderlands 2 store, then it downloaded 5.50 GB worth of DLC. I was really excited because I got to play the Headhunter DLC that was just released. I got to play the game on PS3, PS4, and Vita at the same time. I don't know what's new in the update other than a lot of DLC and some new things. Here we have developed two models to explain how chromosomal rearrangements can be acquired during evolution: mutations during cell division with subsequent cytotoxic selection. We have developed two models to explain how chromosomal rearrangements can be acquired during evolution: mutations during cell division with subsequent cytotoxic selection, and the process of massive accumulation of the same mutation during evolution. We have also developed mathematical models that give us a greater understanding of how the immune system could affect the rate of accumulation of mutations and rearrangements. Finally, we have developed models to study the association between the de novo appearance of a chromosomal aberration (in a newborn) and the evolution of this aberration (with time) in the germline. The objective of the present proposal is to understand better the impact of mutagenesis and repair mechanisms in the evolution of new chromosomal rearrangements. We will focus on high-frequency chromosomal deletions (homologous and non-homologous) because these deletions can acquire new sequences during evolution. These new sequences are likely to create fusion genes that are expressed in tumor cells (or germ cells), which is a characteristic of many human malignancies. If we understand how rearrangements can be acquired during evolution, we will be in a better position to understand how these mutations become established in tumors. We also propose to understand better how chromosomal rearrangements can be detected during evolution.
