The present invention relates to a technique for detecting face images of subjects to specify an individual face region of a subject, and a technique for detecting a face in video data. With advancement of digital cameras, digital video cameras, and the like, various types of data including video data is generated, and various techniques have been proposed for detecting and specifying a face of a person from the generated data. As a typical technique for detecting a face of a person, a technique for detecting the position of a person is known (see, for example, JP-A-2008-113026). In the technique disclosed in JP-A-2008-113026, a detection area is divided into a plurality of regions in the image; a feature is calculated in each region; the feature is compared for the respective regions to detect the position of the person; and the position of the face is detected by the position of the person. The technique disclosed in JP-A-2008-113026 can detect a face in the image. However, since the detection area is divided into a plurality of regions, the technique has a problem of requiring a large amount of processing time. Thus, it is difficult to detect a face in video data in a short time. those are white, it's almost as if we go into a sort of hyper-focus on the visual of the costumes. When something's white, you just kind of almost go, 'oh, okay. Cool. I get it.' And we don't feel like that about black costumes. It's almost like,

---

'Well, no one's going to see that. I'm not going to stand out.'" They had to pick a mascot who was white and someone who wasn't white, and Liefeld remembers thinking, "It can't be that hard. We already have a black character." "Once we'd decided that a white person would be a given, it was like, 'Oh, okay. Black.' Which is kind of what made it even harder, because the idea of a black superhero still wasn't mainstream at that time. People were like, 'You can't do this. People are not going to accept this.'"

I'm thinking of the best way to share a database connection from one project to the next, so that my projects don't have to have their own separate connection strings to the database. I'm using Visual Studio 2008, and SQL Server 2008. Thanks A: You can reuse the same connection, however the connection string

---

may be different for each project. If you reuse the connection you just make sure that you reuse the connection string. By the way, when you reuse a connection string you are reusing the connection (no need to look for multiple connections). You should not see any performance problems. Just make sure that you don't reuse the connection across more than one connection. Also, here's a blog entry that I wrote about how you can reuse connections (along with lots of other cool things): [Q: Java: Call System.out.println\(\) within a thread? I have an Android Application with a thread which runs with the following code:](#)

```
Thread thread = new
    Thread(new Runnable() { public void run() { if
(textView.getText().length() != 0) { outputFile = "Score";
        File outputDir = new
File(Environment.getExternalStorageDirectory(),
            2d92ce491b
```
