What's New In?

Bring order and rigidity to your design. Simply draw a layer that represents the layout of your components, like the inner supports, with Line/Freeform commands and insert it into your drawing. AutoCAD will then figure out what to do with the layer based on the design intent of the component. For example, AutoCAD can determine that an inner support is a beam and should be inserted as a diagonal, or a wall and should be inserted as a perpendicular vertical wall. (video: 3:12 min.) Note: Depending on the scope of the design, you might need to do more than one insertion of layers into your drawing. Fully editable and annotatable. Unlock layers in any state, whether they're locked, unlocked or partially locked and annotated. In an unlocked layer, you can make changes freely to the shape, color, linetype, lineweight, dimensions and fill of components and features. (video: 3:12 min.) Use any 3D or 2D editing tool as you edit the components. You can also draw a vertical/horizontal snap, extents and lines, add/remove/resize annotated components and change shapes and colors. Label-associated text tools. You can use the Label tools to create and position text on components. In addition, you can add annotations to the parts, with the text automatically positioned relative to the component. Map canvas support. Use the Map canvas to quickly create maps of your architectural plans. Import the map from a print, PDF or online service, and position it on a reference line to begin creating your design. Map panels let you quickly make an outline of your design. And when you close the panel, you can edit the map manually, or you can use multiple panels to keep it open at all times. Tools that optimize the creation of architectural drawings. There are new command groups for drawing: Line/Freeform, Text, Arc/Sweep, Dimension, B-spline, Axes, Fillet/Chamfer, Intersect/Subtract and even 3D. These command groups have tools that are much easier to use. Some of these enhancements are available now.
